### ■ DESCRIPTION

HTR3316 is a 16 multifunctional LED driver and GPIO controller with 2.5V~5.5V power supply. Any of the 16 IOs can be configured as LED mode or GPIO mode. Meanwhile, any GPIO can be configured as an input or an output independently.

After power on, all the 16 IOs are configured as GPIO output as default, and their default states are decided by AD0 and AD1. When the IOs are configured as inputs, they are continuously monitored for state changes with 8μs deglitch. State changes are indicated at the INTN output. Once the GPIO state are read through the I<sup>2</sup>C interface, the INTN output is cleared.

When the IOs are configured as LED mode, the LED driver's current, divided by 256 steps linear dimming, can be set between 0~I<sub>MAX</sub> by I<sup>2</sup>C interface. The default maximum current (I<sub>MAX</sub>) is 37mA, and I<sub>MAX</sub> can be changed in GloCTL register.

HTR3316 supports breathing function to implement different lighting effects in an much easier way with two modes: blinking mode and fading mode.

HTR3316 is available in QFN4×4-24L package.

HTR3316是一款16路多功能LED驱动器和GPIO控制器, 2.5V~5.5V电源供电。16个IO端口中的任何一个都可以配置为LED模式或GPIO模式。此外, 任何GPIO都可以单独配置为输入或输出。

## ■ TYPICAL APPLICATION

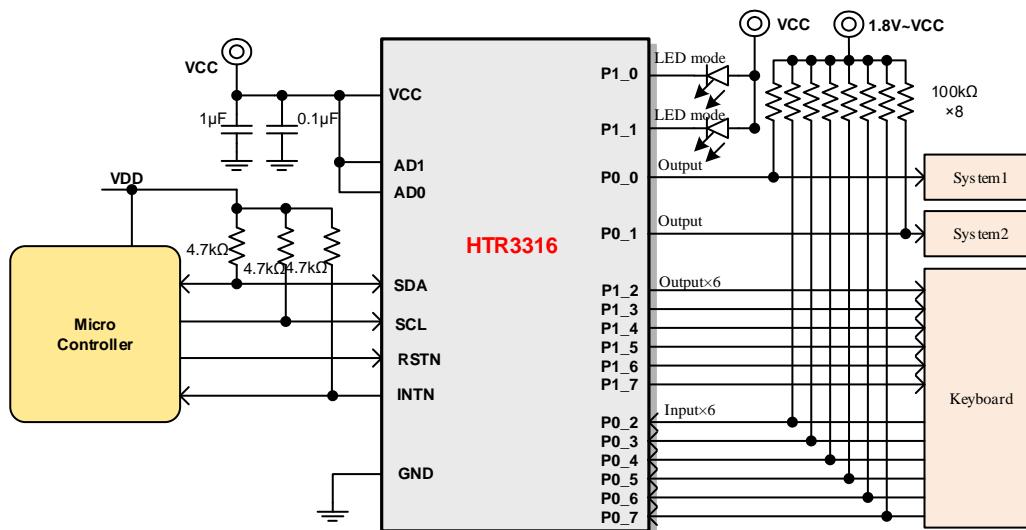

16 functional LED drivers, with 6 capable of driving LED backlights

Once the LED anode is pulled to VCC, AD1 and AD0 terminals must be pulled to VCC to ensure that the default value of GPIO after POWER ON is High or Hi-Z so that the LEDs are not working unexpectedly. The default value of GPIO after POWER ON is decided by AD1 and AD0 terminals (see table 1).

The Dropout performance of the 6 LED Ports (P1\_0~P1\_3, P0\_0~P0\_1) is optimized, so that they are capable of driving LED backlights.

当LED的阳极接VCC时，需将芯片的AD1/AD0接VCC，确保GPIO的上电默认状态为高或高阻，从而LED不会意外工作。GPIO的上电默认状态由AD1/AD0的电平决定，具体参看表1。

P1\_0~P1\_3, P0\_0~P0\_1这6路的驱动能力做了优化，在驱动LED背光时建议选取这几路。

Any of the 16 IOs can be configured as LED mode or GPIO mode. In the above schematic, P1\_0 and P1\_1 are configured as LED mode, P0\_0 and P0\_1 is configured as GPIO output to control other systems, P1\_2~P1\_7 are configured as GPIO output to drive the row line of keyboard, and P0\_2~P0\_7 are configured as GPIO input to drive the column line of keyboard

16路IO均可配置为GPIO或LED模式。在上图中，P1\_0和P1\_1配置为LED模式，P0\_0和P0\_1配置为GPIO输出模式用来控制其他系统，P1\_2~P1\_7配置为GPIO输出用来驱动键盘的行，P0\_1~P0\_7配置为GPIO输入用来驱动键盘的列。

HTR3316 supports breathing function to implement different lighting effects in an much easier way with two modes: blinking mode and fading mode.

HTR3316是一款I<sup>2</sup>C接口、16路呼吸灯及16路扩展GPIO控制器，它包含16路双向GPIO端口，其中每路可通过指令配置为LED驱动模式。在GPIO模式下，每一路GPIO可单独配置为输入或输出。

通电后，16个IO端口配置默认为GPIO输出，默认状态根据AD0和AD1决定。所有配置为输入的IO端口都会持续监控状态变化，并具有8 $\mu$ s的防抖动时间，IO口的变化由INTN输出指示。当GPIO状态通过I<sup>2</sup>C接口被读取时，INTN输出被清除。

HTR3316支持breathing功能，使其实现灯效变得更为容易，其有两种模式:blinking模式和fading模式。

### 1 Power On

Once HTR3316 is powered on, at least a 100 $\mu$ s delay is required before RSTN is pulled high. After RSTN is high, at least a 5ms delay is required before I<sup>2</sup>C communication. The recommended power on sequence is as below.

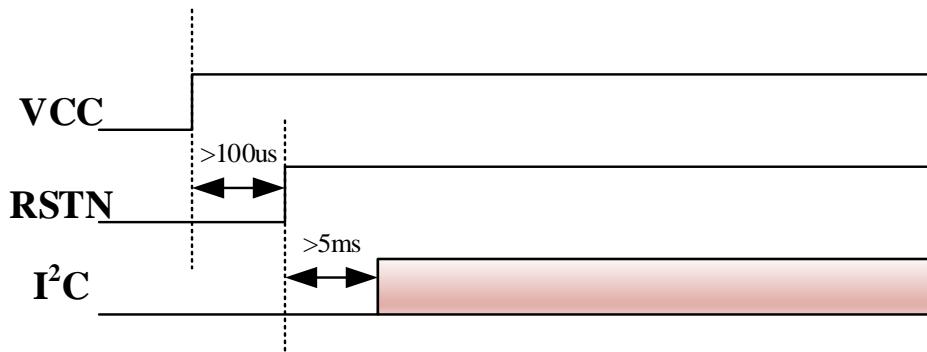

Figure 1 Power On Timing

### 2 GPIO Output

After power on, all the 16 IOs are configured as GPIO output as default, and the states are decided by AD0 and AD1 (see table 1 for detail). GPIO P1 is Push-Pull structure; the default of GPIO P0 is Open-Drain structure and can be configured as Push-Pull structure. Once in Open-Drain stucture, the GPIO needs pull-up resistor.

上电后，16路IO口默认为GPIO模式的输出状态，其输出状态可通过AD1、AD0脚进行配置，具体配置方式见表1。P1端口为Push-Pull结构；P0端口默认为Open-Drain结构，可通过配置全局控制寄存器设定为Push-Pull结构。GPIO设置为Open-Drain结构时，需外接上拉电阻。

Table1 Default State of IOs decided by AD1 and AD0 terminals

AD1	AD0	P1_7~P1_4	P1_3~P1_0	P0_7~P0_4	P0_3~P0_0
GND	GND	0	0	0	0
GND	VCC	0	1	0	Hi-Z
VCC	GND	1	0	Hi-Z	0
VCC	VCC	1	1	Hi-Z	Hi-Z

### 3 GPIO Input or Output Selection

The register In/Out\_P0 and In/Out\_P1 can configure IOs as input or output. Each bit of the register is corresponding to each IO, the bit set ‘1’ as input, ‘0’ as output. The default value is ‘0’ as output.

In/Out\_P0 和 In/Out\_P1 设定端口为输入、输出状态。寄存器每一 Bit 对应某个 GPIO 端口，该 bit 置 ‘1’ 代表输入状态，置 ‘0’ 代表输出状态。默认值为 0，输出状态。

### 4 GPIO Input

The state of GPIO can be read through I<sup>2</sup>C in the register Input\_P0 and Input\_P1. The GPIO support 1.8V logic input.

通过 I<sup>2</sup>C 接口读 Input\_Port0 和 Input\_Port1 可获得当前 GPIO 端口逻辑状态。GPIO 口支持 1.8V 逻辑输入。

### 5 Interrupt Function

HTR3316 will monitor IO state once IO is configured as input GPIO, and GPIO interrupt function is enabled. The change of input GPIO status (from high-level to low-level or from low-level to high-level, with 8us internal deglitch) can trigger a low state of INTN terminal. INTN is open-drain output, active low, which needs external pull-up resistor.

一旦 IO 配置为 GPIO 输入，且 GPIO 中断功能启用，HTR3316 将监控 IO 状态。输入 GPIO 状态的改变（由低变高或由高变低，8μs 去抖动处理）会触发 INTN 脚的拉低。INTN 是开漏输出，低电平有效，需要外部上拉电阻器。

When the GPIO input status (Input\_P0, Input\_P1) is read through the I<sup>2</sup>C interface, the interrupt can be cleared. When a certain GPIO port is configured to output mode, or the interrupt enable is disabled, the change of its state will not cause interrupt.

通过 I<sup>2</sup>C 接口读取 GPIO 输入状态（Input\_P0 和 Input\_P1）时，可以清除中断。将某一路 GPIO 口配置成输出模式、或关闭其中断使能后，则其状态的变化不会产生中断。

The interrupt caused by the change of P0 status can only be cleared by reading register Input\_P0, and one caused by the change of P1 status can only be cleared by reading register Input\_P1. Meanwhile, the interrupt can also be cleared by reset.

由 P0 口变化产生的中断，只能通过读 Input\_P0 寄存器清除；由 P1 口变化产生的中断，只能通过读 Input\_P1 寄存器清除。另外，还可通过复位功能清除中断。

中断时序如下图。

The interrupt sequence is as below.

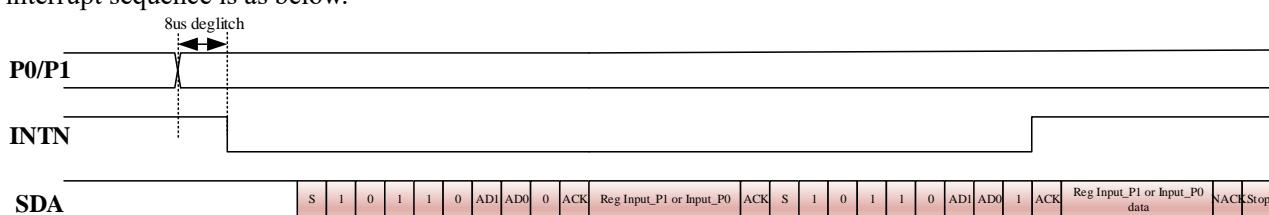

Figure 2 Interrupt Sequence

## 6 LED Mode

HTR3316 can be set as an co-anode current source LED driver through reg 12h and 13h. LED driver's  $I_{MAX}$  is configured by GloCTL (ISEL) register, with 4 different levels. The default  $I_{MAX}$  is 37mA.

Each IO can also carry out 256 step linear dimming through DIMx register, see table 2.

The Dropout performance of the 6 LED Ports (P1\_0~P1\_3, P0\_0~P0\_1) is optimized, so that they are capable of driving LED backlights.

HTR3316 可通过 12H 和 13H 寄存器设置为共阳恒流型 LED 驱动器。驱动电流的最大值 ( $I_{MAX}$ ) 为 37mA (典型), 并可通过寄存器 GloCTL (ISEL) 设置, 共有 4 档。

每一路 LED 还可以通过 DIM 寄存器进行 256 步线性调光, 见表 2。

P1\_0~P1\_3, P0\_0~P0\_1 这 6 路的驱动能力做了优化, 在驱动 LED 背光时建议选取这几路。

## 7 I<sup>2</sup>C Communication

The HTR3316 device has a bidirectional I<sup>2</sup>C interface that is compatible with the Inter IC (I<sup>2</sup>C) bus protocol and supports both 100-kHz and 400-kHz data transfer rates. This is a slave-only device that does not support a multi-master bus environment or wait-state insertion.

The I<sup>2</sup>C bus employs two signals, SDA (data) and SCL (clock), to communicate between integrated circuits in a system using serial data transmission. The address and data 8-bit bytes are transferred most-significant bit (MSB) first. In addition, each byte transferred on the bus is acknowledged by the receiving device with an acknowledge bit. Each transfer operation begins with the master device driving a start condition on the bus and ends with the master device driving a stop condition on the bus. The bus uses transitions on the data terminal (SDA) while the clock is at logic high to indicate start and stop conditions. A high-to-low transition on SDA indicates a start, and a low-to-high transition indicates a stop. Normal data-bit transitions must occur within the low time of the clock period.

The master generates the 7-bit slave address and the read/write (R/W) bit to open communication with another device and then waits for an acknowledge condition. The device holds SDA low during the acknowledge clock period to indicate acknowledgment. When this occurs, the master transmits the next byte of the sequence. Each device is addressed by a unique 7-bit slave address plus R/W bit (1 byte). All compatible devices share the same signals via a bi-directional bus using a wired-AND connection.

Use external pull-up resistors for the SDA and SCL signals to set the logic-high level for the bus.

HTR3316 I<sup>2</sup>C 接口支持双向传输, 该接口与 I<sup>2</sup>C 总线协议兼容, 并支持 100 kHz 和 400 kHz 数据传输速率。这是一个从设备, 不支持多主机的总线环境, 及等待状态下的插入。

I<sup>2</sup>C 总线具有两个信号, SDA (数据) 和 SCL (时钟), 在系统中的器件之间使用串行数据传输进行通信。地址和数据的 8 位字节首先传输最高有效位 (MSB)。此外, 总线上传输的每个字节由接收设备用确认位 (ACK) 进行确认。每个传输操作从主设备驱动总线上的启动条件开始, 并以主设备驱动总线上的停止条件结束。当时钟处于逻辑高电平时, 总线使用数据终端 (SDA) 上的转换来指示启动和停止条件。SDA 上的高到低转换表示开始, 低到高转换表示停止。正常的数据位转换必须在时钟为低时发生。

主机生成 7 位从机地址和读/写 (R/W) 位, 以打开与另一个设备的通信, 然后等待确认条件。在应答时钟周期内, 设备保持 SDA 低, 以指示确认。当发生这种情况时, 主机发送序列的下一个字节。每个设备有唯一的 7 位从机地址加上 R/W 位 (1 字节)。所有兼容设备通过并联的总线共享信息。

SDA 和 SCL 需通过外部上拉电阻截至逻辑高电平。

## 8 Device Address

The device address of HTR3316 can be set by AD1 and AD0 terminals, see as below.

HTR3316 器件地址由引脚 AD1、AD0 设置，如下表。

## 9 Reset Function

There are 3 different ways of reset the registers of HTR3316 into default value: Re-poweron, hardware reset and software reset.

### Hardware Reset

Hardware reset timing is as below.

HTR3316 支持三种复位模式：重新上电、硬件复位和软复位。三种复位模式均能将寄存器复位至默认值。

#### 硬件复位

硬件复位时序如下图。

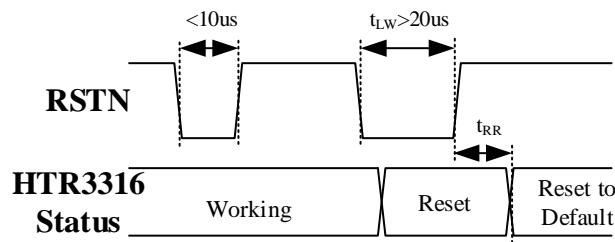

Figure 6 Hardware Reset Timing

Table4 Hardware Reset Parameter

Parameter		Condition	min	typ	max	unit
t <sub>LW</sub>	Reset pulse low level width	VSS=0V, VCC=2.4V~5.5V, T=-40°C~125°C	20			us
t <sub>RR</sub>	Reset recovery time		1			us

**NOTE:**

1. An internal deglitch is integrated to avoid unexpected reset caused by interference on RSTN terminal.
2. After reset, all registers resume to default. The interrupt (INTN) is cleared and pulled up by external pull-up resistor.
3. During a valid reset when low level of RSTN is longer than 20us, any unexpected interference with high-level of less than 10ns will be filtered.

**Software Reset**

Software reset is also available for HTR3316. Writing 00h to the register 7Fh will trigger a reset. After the software reset command is sent through the I<sup>2</sup>C interface, it takes at least 1ms to acknowledge the next I<sup>2</sup>C command.

**10 Breathing Function**

Breathing function is integrated in HTR3306 to implement different lighting effects in an much easier way. OUT0~OUT5 supports breathing function, and Two different modes can be selected in this function: blinking and fading.

**10.1 Blinking mode**

In blinking mode, HTR3306 will blink the LED to breath automatically. The following steps shows how to set the blinking mode.

- (1) Set OUTx into LED mode (register 12h, 13h), enable breathing function (register 14h), and select blinking mode (register 04h, 05h);
- (2) Configure timing parameter, including the delay time before starting blinking (register 17h~1Ch), the fade in and out time (reg 15h), On and off time (reg 16h);
- (3) Enable the bit GO in reg 11h to starting blinking automatically;
- (4) The blinking can be exit by disabling blinking function (reg 14h) or set the corresponding channel into fading mode (reg 04h, 05h). The former will exit blinking mode immediately, and the latter will exit blinking mode after finishing the current blinking period.

**注意:**

1. 硬件复位引脚(RSTN)内置了防抖动电路，以避免有 RSTN 引脚外部干扰误触发 Reset。
2. 复位后，寄存器恢复到默认状态。中断状态 (INTN) 被清除，由外部上拉电阻将其拉高。
3. 在复位脉冲的低电平期间，防抖动电路也将起作用，小于 10ns 的高脉冲将被滤除。

HTR3316 同时支持软复位模式，可通过 I<sup>2</sup>C 接口对寄存器 7Fh 写数据 00h。通过 I<sup>2</sup>C 接口发送软件复位命令后，至少需要 1ms 后，HTR3316 才能识别下一个 I<sup>2</sup>C 命令。

HTR3306 具有 Breathing 功能，使其实现灯效变得更为容易。OUT0~OUT5 支持 breathing 功能，该功能具有两种模式，分别是 blinking 模式和 Fading 模式。

在 blinking 模式下，HTR3306 会自动以类似呼吸状态闪烁 LED。您可以通过以下步骤设置 blinking 模式。

- (1) 设置 OUTx 进入 LED 模式(寄存器 12h、13h)，开启呼吸功能(寄存器 14h)，选择 blinking 模式(寄存器 04h、05h);
- (2) 配置相关时间参数，包括开始闪烁前的延迟时间(寄存器 17h~1Ch)，淡入淡出时间(寄存器 15h)，On / off 时间(reg 16h);
- (3) 使能 reg 11h 中的 GO 位，LED 开始自动呼吸闪烁;
- (4) 关闭 blinking 功能(reg 14h)，或设置相应通道为 fading 模式(reg 04h, 05h)，可退出 blinking 模式。前者可立即退出，后者需要结束当前 blinking 周期后退出。

## 10.2 Fading mode

In fading mode, writing 1 in the corresponding bit of reg 02h and 03h means fading in and remaining bright for the LED channel, writing 0 in the corresponding bit of reg 02h and 03h means fading out and remaining dark for the LED channel. The following steps shows how to set the fading mode.

- (1) Set OUTx into LED mode (register 12h, 13h), enable breathing function (register 14h), and select fading mode (register 04h, 05h);
- (2) Configure timing parameter, including the fade in and out time (reg 15h);
- (3) Control the corresponding bit of reg 02h and 03h to start fading in or fading out; a writing of any bit of reg 02h and 03h will result a fading in or fading out of all channels (OUT0~OUT5);
- (4) The fading can be exit by disabling breathing function (reg 14h).

在 fading 模式下, reg 02h 和 03h 对应位写 1 则该 LED 通道渐渐亮起 (Fading in) 并保持亮常, reg 02h 和 03h 对应位写 0 则该 LED 通道渐渐暗下 (fading out) 并保持常暗。您可以通过以下步骤设置 fading 模式。

- (1) 设置 OUTx 进入 LED 模式(寄存器 12h、13h), 开启呼吸功能(寄存器 14h), 选择 fading 模式(寄存器 04h、05h);
- (2) 配置相关时间参数, 包括淡入淡出时间 (寄存器 15h);
- (3) 控制 reg02h, 03h 中相应位, 开始渐亮或渐暗; 写其中的任意 bit 位将会带来所有通道 (OUT0~OUT5) 的一次 Fading in 或 Fading out
- (4) 关闭 fading 功能(reg 14h), 可退出闪烁(reg 04h, 05h)。

**Register Address: 00h, 01h, Input state of P0, P1 terminals (default value is determined by each GPIO status)**

Address	Name	Default	Description
00h	Input_P0	x	The current logic status of P0 terminals: 0-low level; 1-high level P0 端口引脚当前逻辑状态。0-低电平；1-高电平
01h	Input_P1	x	The current logic status of P1 terminals: 0-low level; 1-high level P1 端口引脚当前逻辑状态。0-低电平；1-高电平

Registers 00h,01h reflect the logic status of the GPIO terminals, regardless of whether the pin is defined as an input or an output. They can only be read but not written by I<sup>2</sup>C interface. The default value of the two registers are determined by the externally applied logic level.

Bits 7 to 0 of register 00h correspond to the input status of P0\_7 to P0\_0 terminals, bits 7 to 0 of 01h correspond to the input status of P1\_7 to P1\_0 terminals.

寄存器（00h, 01h）用以反映 GPIO 口当前的逻辑状态，不论该 GPIO 口是配置为输入模式还是输出模式。该寄存器仅支持读操作；写操作无效。其默认值由外部引脚电平决定。

寄存器 00h 的第 7 至第 0 位依次对应 P0\_7~P0\_0 的输入状态，01h 的第 7 至第 0 位依次对应 P1\_7~P1\_0 的输入状态。

The Configuration registers (04H, 05H) configure the directions of the IO pins. If a bit in this register is set to 1, the corresponding port pin is enabled as an input with a high-impedance output driver. If a bit in this register is cleared to 0, the corresponding port pin is enabled as an output.
